

Peer Review Assignment 2 Group 8

- Can you define the security issue more precise? What is exactly the problem that results from Phishing? What is the asset at risk?
- Why talk at all about the Netherlands when it's the States you're focussing on
- Again, what exactly is the asset that the department is trying to defend?
- Metric "Top 10 country per botnet" is vague and not normalized. Are you measuring whether the country is in the top 10? Of course the country with the most servers is going to win (USA) and the country with the least going to lose (North-Korea)
- Same goes for all the other metrics, they are not normalized.
- Risk strategies: get the asset at risk better defined. If this would be access to information and phishing (form of social engineering) is the mean to get to the info, you can think of many more risk strategies than just e-mail based
- Maybe add a formal chart to provide an overview of actor relations
- Risk strategies seems well founded in literature
- ROSI: very long (but seemingly good) introduction to calculations and where numbers are from
 - However: jump to ROSI calculation a bit abrupt. Maybe recap where numbers come from after such a long piece?
- Conclusion: the exact ROSI number doesn't really matter, as long as it is positive or negative.
